RE: Comments for RSPA-04-17167 -

Selah Moxee Irrigation District is requesting regulatory flexibility from the recently revised 49 CFR 173.226 (a) which states (materials poison by inhalation will be transported) in seamless specification cylinders conforming to the requirements of 173.40, as well as other provisions within 49 CFR 173.40.

Selah Moxee Irrigation District is a district that supplies irrigation water to 7,300 acres of land in the Moxee Valley of Washington. Crops in the valley will not grow without water. The irrigation district operates on a tight budget and is attempting to install improvements as the opportunity and budget allow.

In the areas we supply irrigation water, acrolein is used for the control of aquatic weeds and algae in irrigation canals under the trade name, MAGNICIDE H Herbicide. It is a vital tool in controlling submerged aquatic weeds and algae to allow for the efficient operation of the irrigation system. Local farmers rely on these irrigation systems to irrigate their crops. If the control of submerged weeds is interrupted, the water deliveries will decrease, thus disrupting irrigation operations throughout our delivery area. At this time we are expecting a serious drought. We must supply our reduced amount of water as efficiently as possible. As the end users of acrolein, our customers are dependent on the efficient supply of irrigation water to maintain our operations. With the current economic downturn impacting the agriculture industry, significant additional operating costs would be difficult to pass along to the water users.

Baker Petrolite maintains the pesticide registration with the U. S. Environmental Protection Agency for acrolein as an aquatic herbicide. There are no other alternatives available that work in the manner in which MAGNICIDE H does in flowing irrigation water.

For many years we have received acrolein in 4BW240 cylinders, which are manufactured of carbon steel. Over the years we have developed our safety program and operations to utilize these cylinders. Converting our operations to utilize another form of packaging would be a major expense that would ultimately impact our water users. The current size of the cylinders provides a volume of material that is appropriate for the applications for

which they are used. This allows the fewest number of connections and disconnections of application equipment, and thus the lowest risk to our personnel. The cylinder dimensions allow the personnel to install the application equipment and to operation the related valving at a safe and comfortable height. Any change in the design will impact our application equipment, procedures, and established safety programs with acrolein.

Due to the nature of acrolein great efforts have been made in the equipment design, maintenance, and inspection, as well as in the training to ensure the safety of all involved in the application of acrolein.

Based on discussions with Baker Petrolite, to manufacture to the new specification 3B cylinders would be very expensive and they cannot be constructed to meet applicator safety requirements. A new specification 3B cylinder manufactured to hold a comparable amount of liquid needed for applications would be between 6 and 7 feet tall, which is too tall to work with safely in the field. The other choice is to require the use of a drum in a drum type container. These types of containers are bulky and difficult to handle. Furthermore, the structural integrity of the drum in a drum is no comparison to that of the present 4BW240 cylinder.

We also feel strongly that the pressure relief device utilized by Baker Petrolite should remain in place at all times for the highest level of safety.

Selah-Moxee Irrigation District believes that there should be regulatory flexibility from the recently revised 49 CFR 173.226(a) as well as other provisions within 49 CFR 173.40. Acrolein has been shipped in 4B W 240 Cylinders without risk to property and safety for many years. As previously stated, there are no alternatives available that work in the manner in which MAGNICIDE H does in flowing irrigation water. Due to the effectiveness of acrolein on weed and algae control in irrigation systems, wee have developed operational processes using these cylinders that would not be cost or time effective to change. The impact that 49 CFR 173.226(a) has placed on our supplier of acrolein to obtain 3B "seamless" cylinders will increase costs, minimize safety, and ultimately affect our operations. We applaud your efforts in increasing the safety of transporting hazardous materials that are Poisonous by Inhalation. We ask your assistance in carefully evaluating the impacts that the change in cylinder specifications will have on small businesses in agriculture that depend on acrolein. We are receptive to finding the safest and most practicable resolution to this matter.

Sincerelly, Lemuth (Mitchell

Kenneth C. Mitchell, Manager
